REG NO: C11/26/DFIT/17297

SCHOOL: School of Internship Training

DEPARTMENT: Digital Forensics

ACADEMY: ICDFA

COURSE CODE: CIP-B104

COURSE TITLE: Computer Forensics Case Study I

LAB TITLE: Digital Currency and Chrome Web History:
Cryptocurrency Transaction Reconstruction

DATE: 12th September, 202

Executive Summary

This report presents the forensic examination and reconstruction of browser activity recovered from a Google Chrome History SQLite database associated with a suspected online drug trafficking transaction involving cryptocurrency. The investigation was conducted in accordance with accepted digital forensic principles, including evidence preservation, integrity verification, timeline reconstruction, and evidential interpretation. The objective was to evaluate whether the available browser artifacts support the proposed seven-stage hypothesis that a suspect used online services to advertise illegal drugs, communicate with a buyer, exchange Bitcoin payment information, verify payment, and complete a transaction. The primary source of evidence was the Chrome History database and its associated records, including URLs, visits, downloads, redirects, transition types, and timestamps contained within the supplied training evidence.

Analysis of the browser history revealed a detailed sequence of user actions beginning with a search for Craigslist, followed by navigation to the Baltimore Craigslist region, account authentication, and a complete advertisement creation workflow. Multiple form submissions, category selections, content editing pages, preview pages, publication confirmation pages, management pages, and a published advertisement titled "Cheaper than Rx Supplements" were identified. These artifacts demonstrate deliberate and sustained user interaction consistent with the creation and publication of an online classified advertisement. The transition values and URL structures further support that the activities were initiated by the user rather than generated automatically by the browser.

Following publication of the advertisement, the browser history showed access to a Gmail account identified as unsub.fscs@gmail.com. The evidence indicates that the user successfully navigated to the mailbox, opened an email thread associated with the advertisement, and subsequently generated multiple reply actions within the same message chain. The email subject references and compose-related URLs demonstrate communication activity between the account holder and another party regarding an order connected to the Craigslist advertisement. While browser history does not preserve email content, the navigation patterns and message identifiers provide strong evidence that active correspondence took place.

Subsequent artifacts revealed evidence of cryptocurrency-related communications. The examination identified a separate email containing a Bitcoin transaction identifier (TXID) and an Imgur-hosted payment receipt accessed directly from Gmail. Browser artifacts showed that the user followed a Gmail-generated link to the Imgur image, reviewed the receipt, and downloaded a file named **proof_of_payment.png** to the local system. The temporal relationship between the payment receipt, the downloaded image, and the immediate transition to blockchain verification resources strongly suggests that the image represented evidence of a completed Bitcoin payment submitted by the buyer.

The investigation further identified extensive blockchain verification activity. The user searched for a blockchain explorer, navigated to Blockchain.com Explorer, searched for a specific Bitcoin transaction, reviewed the associated transaction record, and examined the linked wallet address **38RcsURWCDmCbYocmsZCnGz1FtD7x477mt**. The transaction identifier visible throughout the evidence was:

517b2156914944339a96137ad8978408ea52b2fc144c98d3b0b16b21888afdc5

Additional activity included access to the cryptocurrency exchange Kraken, successful account authentication, funding-page navigation, ledger-history review, and transaction validation via Mempool.space. These actions collectively demonstrate a deliberate effort to verify the status and authenticity of the cryptocurrency transaction reported by the buyer.

Based on the totality of the evidence, the investigation found strong support for the stages involving advertisement creation, buyer communication, delivery of payment instructions, receipt of payment information, and payment verification. However, no direct browser-history evidence was recovered to confirm the physical shipment of drugs or receipt of drugs by the buyer. Therefore, those final stages remain inferential rather than directly supported. Overall, the reconstructed timeline presents a coherent sequence of actions that is highly consistent with an online transaction facilitated through Craigslist, Gmail, and Bitcoin-related services.

Answers to Required Findings

1. Which evidence supports that the suspect deliberately created and published a Craigslist post?

Evidence includes:

- Search for "craigslist" (Visits 1-2).
- Navigation to Craigslist (Visits 3-5).
- Craigslist account login (Visits 6-8).
- Selection of posting type and category (Visits 11-15).
- Completion of posting forms:
 - Description
 - Price
 - Delivery information
 - Location
 - Images
- Preview page reached (Visit 18).
- Publication confirmation page reached (Visit 19).
- Post management page visited (Visit 20).
- Active advertisement viewed: baltimore-cheaper-than-rx-supplements/7473121658.html (Visit 21).

Conclusion

The posting workflow contains multiple form submissions and publication confirmation pages, making accidental creation highly unlikely.

2. Which records support communication with an interested buyer?

Evidence:

Gmail Login and Inbox Access

Visits:

- 24-41

These visits show:

- Gmail access.
- User authentication.
- Inbox loading.
- Opening a specific email message.

Opened Buyer Email

Visits:

- 42-43

The subject shown:

"cheaper than Rx supplements - order"

The message ID is visible in Gmail URLs, indicating a specific email conversation was opened.

Conclusion

The opened order-related email supports communication with an interested buyer.

3. What browser evidence supports delivery of Bitcoin payment instructions?

Evidence:

Visits 44-45

The browser history shows:

- Reply creation actions.
- Gmail compose URLs.
- Multiple replies associated with the same order email.

URLs contain:

?compose=

These indicate response messages were being drafted and sent regarding the order thread.

Conclusion

The reply activity immediately following the order email strongly supports sending transaction/payment instructions.

4. What evidence supports that the buyer sent payment?

Visits 46-48

The suspect returned to Gmail.

A new message was opened whose title contained:

txid: 517b2159...

This indicates a buyer supplied a Bitcoin transaction identifier.

Additional Evidence

Visit 49:

- User opens Imgur link.
- URL parameter:

source=gmail

This indicates the link was received through Gmail.

The Imgur image reportedly contained:

- Bitcoin payment evidence.
- Wallet address.
- Amount paid.
- Blockchain reference.

Conclusion

The TXID email and Imgur receipt strongly support buyer payment.

5. What supports payment verification or confirmation?

After receiving the TXID:

Visits 51-52

Search:

blockchain explorer

Visits 53-58

User:

- Opened Blockchain Explorer.
- Searched TXID.
- Viewed TXID details.
- Opened wallet address page.

Visits 59-71

User then:

- Accessed Kraken.
- Logged into Kraken account.
- Opened Funding page.
- Opened Mempool transaction page.
- Viewed Ledger History.

These actions constitute a payment verification workflow.

Conclusion

Strong evidence exists that the suspect verified the payment on blockchain services.

6. What file was downloaded and how is it connected to the payment evidence?

Downloaded file:

proof_of_payment.png

Location:

C:\Users\FSCS_User\Desktop\

Timeline relation:

- Download occurred after opening Imgur receipt.
- Download occurred before blockchain verification search.

This timing strongly links the file to the payment confirmation image.

Conclusion

The downloaded image appears to be the payment receipt used as evidence of Bitcoin transfer.

7. Which TXID/address/exchange activity is visible, and what can it prove?

TXID

517b2156914944339a96137ad8978408ea52b2fc144c98d3b0b16b21888afdc5

Wallet Address

38RcsURWCDmCbYocmsZCnGz1FtD7x477mt

Exchange Activity

Kraken:

- Sign-in page
- Device approval
- Trading section
- Funding section
- Ledger history page

Blockchain Services

- Blockchain.com Explorer
- Mempool.space

Evidence proves:

User accessed transaction record.

User viewed wallet address.

User checked exchange records.

Evidence does **not** prove ownership of wallet with absolute certainty.

Evidence does **not** prove funds were ultimately spent or withdrawn.

8. Which shipment/receipt stages are directly supported versus inferred?

Directly Supported

- Advertisement creation.
- Buyer communication.
- Bitcoin instructions.
- Bitcoin TXID receipt.
- Payment verification.

Inferred

- Packaging goods.
- Shipping goods.
- Delivery to buyer.
- Receipt of goods.

No shipping website activity, tracking numbers, postal records, or delivery confirmations exist in browser history.

9. What alternative explanations or browser-history limitations remain?

Alternative Explanations

- User may simply be researching cryptocurrency.
- Gmail replies may concern legal products.
- Wallet viewed may not belong to suspect.
- Downloaded image could be retained for reference only.

Browser History Limitations

Chrome History stores:

- URLs
- Titles
- Timestamps
- Transitions

It generally does not store:

- Email body contents
- Attachments
- Cryptocurrency ownership
- Transaction intent
- Shipment records

Thus conclusions are based on activity correlation rather than direct content.

10. What is your final confidence that the complete online transaction sequence occurred?

Stage	Confidence
Craigslist post created	High
Buyer contacted seller	High
Bitcoin instructions sent	High
Buyer submitted payment	High
Payment verified	High
Drugs shipped	Low
Drugs received	Low

Overall Assessment

High confidence (approximately 85-90%) that:

- A Craigslist advertisement was published.
- Communication occurred through Gmail.
- Bitcoin payment information was exchanged.
- A Bitcoin transaction was received and verified.

Moderate to low confidence regarding shipment and delivery because no direct shipping evidence exists.

Seven-Stage Hypothesis Matrix

Stage	Evidence	Support
1. Advert posted	Visits 1-21	Strong
2. Buyer contact	Visits 42-43	Strong
3. Payment info sent	Visits 44-45	Strong
4. Payment sent	Visits 46-50	Strong
5. Payment verified	Visits 51-71	Strong
6. Drugs shipped	No direct evidence	Weak
7. Buyer received drugs	No direct evidence	Weak

Key Timeline (UTC)

Time Sequence	Activity
09:54	Craigslist search
09:54-09:58	Ad creation process
09:58	Ad published
09:58	Ad management page
09:59	Gmail login
09:59-10:04	Order email opened
10:04	Replies sent
10:04	TXID email received
10:56	Imgur payment receipt viewed
10:57	proof_of_payment.png downloaded
10:59	Blockchain Explorer search
10:59	Transaction page viewed
10:59	Wallet address viewed
11:00	Kraken login
11:01	Mempool transaction verification
11:02	Further Gmail replies

Professional Conclusion

The forensic examination of the Google Chrome History database revealed a coherent and corroborated sequence of browser activities demonstrating the use of Craigslist, Gmail, cryptocurrency services, and blockchain-analysis platforms. The recovered evidence establishes that the user intentionally accessed Craigslist, authenticated an account, created and published a classified advertisement, managed the posting, and subsequently accessed Gmail to engage in communications relating to that advertisement. These findings are supported by URL records, visit histories, transition values, form-submission artifacts, and publication-confirmation pages recovered from the browser history database.

Further analysis identified email activity consistent with order-related communications and subsequent reply actions. The evidence indicates that the user participated in message exchanges associated with the advertised item and later received information referencing a Bitcoin transaction identifier. The presence of an Imgur-hosted payment receipt accessed from Gmail, together with the download of **proof_of_payment.png**, provides additional support for the conclusion that payment evidence was received and reviewed by the account holder.

The investigation also identified extensive efforts by the user to validate the reported cryptocurrency transaction. The transaction identifier **517b2156914944339a96137ad8978408ea52b2fc144c98d3b0b16b21888afdc5** was traced through multiple browser artifacts, including Blockchain.com Explorer, Mempool.space, and Kraken-related activity. These actions demonstrate a deliberate verification process involving transaction lookup, wallet examination, exchange-account access, and transaction-history review.

The consistency across these independent artifacts significantly increases confidence in the reliability of the reconstructed sequence.

From an evidential perspective, the browser-history records provide strong support for the following findings:

- Creation and publication of a Craigslist advertisement.
- Communication between the user and an interested buyer.
- Transmission of cryptocurrency payment instructions.
- Receipt of Bitcoin transaction information from the buyer.
- Verification of the reported Bitcoin payment.
- Download and retention of a payment-related image file.

Notwithstanding these findings, browser-history evidence alone cannot definitively prove the contents of communications, ownership of cryptocurrency wallets, transfer of physical goods, or successful delivery of any item. No shipping records, logistics documentation, tracking information, delivery confirmations, or physical evidence were identified within the examined dataset. Consequently, while the evidence strongly supports the existence of an online transaction and cryptocurrency payment workflow, the final stages involving shipment and receipt of drugs cannot be established with the same degree of certainty.

In conclusion, it is my professional opinion that the recovered browser artifacts provide **high confidence** that a complete online transaction process occurred involving advertisement publication, buyer communication, exchange of Bitcoin payment details, submission of payment evidence, and subsequent payment verification. The evidence forms a logically consistent

timeline and substantially supports the first five stages of the investigative hypothesis. However, the final shipment and receipt stages remain unsupported by direct digital evidence and should therefore be treated as reasoned inferences rather than proven facts. Based on the available artifacts and their corroborating nature, the overall reconstruction is assessed as reliable, reproducible, and forensically defensible.
